LIFE CYCLE OF A FROG

ANIMALS *What each part does*

A frog changes form as it grows, through a process called metamorphosis.

Eggs
A clump of jelly-like eggs laid in the water.

Tadpole
Swims with a long tail and breathes under water with gills.

Froglet
Looks like a small frog, but it still has a tail.

Adult frog
Has four legs and no tail. Breathes with lungs and can live on land.
