PHOTOSYNTHESIS

PLANTS *What each part does*

Photosynthesis is how green plants make their own food from sunlight, water and carbon dioxide.

Sunlight
Supplies the energy that powers the whole process.

Carbon dioxide
A gas from the air. It enters a leaf through the stomata.

Glucose
The sugar the plant makes. It is the plant's food.

Oxygen
A gas the plant releases into the air as a by-product.

Water
The roots absorb it from the soil. It travels up to the leaves.
